

RFRP # 11/12-002 Drilled Shaft Resistance Based on Diameter, Torque and Crowd (Drilling Resistance vs. Rock Strength)

Addendum # 1

The maximum amount of funding available for this project has been increased to \$250,000.00 due to the addition of Objective 5.

The following objective is being added to Exhibit A:

- 5) A load test will be performed on the drilled shaft constructed in Objective #4 to assess actual unit side shear properties of the rock socket. These values will be used to verify the correlations developed in Objective #2. Sizing of the demonstration drilled shaft will be evaluated based upon the following: (1) practical considerations of the drilled shaft load testing, (2) obtaining the necessary information to verify the rock socket parameters versus correlated parameters, and (3) budgetary constraints.
